OxyBeat: Your Personal Health Monitor

Welcome to OxyBeat, your all-in-one health and environmental monitoring device. Designed for simplicity and accuracy, OxyBeat provides real-time health readings and smart alerts to keep you informed and safe. This guide will walk you through its key features and how to use them.

Understanding Your Device

Your OxyBeat system is built around three main components: a *central unit with an OLED display, a buzzer and LEDs* for alerts, and the *Blynk app* for remote monitoring.

Device Readings & Indicators

The *OLED display* on the main unit is your command center. It shows the following readings in real-time:

- **Body Temp:** Your current body temperature.
 - **BPM:** Your heart rate in beats per minute.
 - **SpO2:** Your blood oxygen saturation level.
-

-
- **Room Temp:** The current room temperature.
 - **Humidity:** The humidity level in the room.
-

Alert System

The system uses a simple, intuitive alert system:

- **Buzzer:** If your *body temperature* is outside the normal range, the buzzer will turn on to alert you. Once your temperature returns to normal, the buzzer will automatically turn off.
-

Green LEDs: You have two green LEDs. One will light up when the **room temperature** is within the normal range, and the other will light up when the **humidity** is in a good range. If either value becomes abnormal, the corresponding green LED will turn off.

Red LED: This LED is for your eye health! It will turn on if you get **too close to your PC or laptop monitor**, reminding you to maintain a healthy distance.

Remote Monitoring with Blynk

The true power of OxyBeat lies in its connection to the Blynk app. This allows you to monitor all your readings from anywhere.

Key Features in the App:

- **Real-time Gauges:** View *your body temperature, BPM, SpO2, room temperature, and humidity* on digital gauges. This gives you an at-a-glance overview of your health and environment.
-

-
- **Historical Data:** Use the *graph widgets* in the app to track your *body temperature, BPM, and SpO2* over time. This is great for spotting trends and sharing data with your doctor.
 - **Smart Notifications:** Blynk will send you an *email and a push notification* on your phone if *your body temperature, BPM, or*

SpO2 levels are abnormal. This ensures you're immediately alerted to any health concerns, even when you're not near the device.
